Learned Control

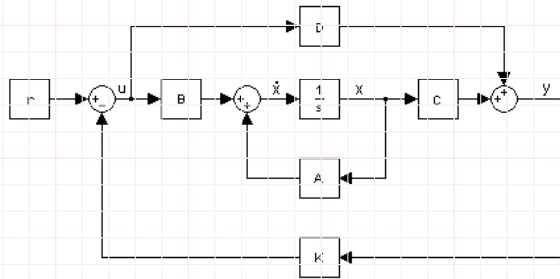

Conclusion

Introduction

What are we talking about

Control a Linear system

Use Spiking neural networks

[Xue+22]

What are we talking about

Control a Linear system

- Tracking of reference trajectory

$$\begin{aligned}\dot{x} &= Ax + Bu \\ y &= Cx\end{aligned}\quad (1)$$

Only stable systems

Use Spiking neural networks

- Third Generation of NN
- Working with discrete spikes
- Inherently fit for temporal data

Goal / Motivation

Artificial SNN can already solve various cognitive task such as

- Memorization
- Basic Logic
- Simulation of Dynamic Systems
- Control

Although with varying levels of biologic plausibility. We set out to build a controlled dynamic system based on SNN using learning and biologic plausibility

- Allow for black-box deployment without manual parameter tuning
- "Limit ourselves to use the brains capabilities to design a controller"

Method

1. Simulate

Use a spiking network to simulate a dynamic system

2. Control

Devise a control scheme to control the network output

3. Learn

Apply biologically plausible learning rules to our network

4. Combine

Integrate all three steps into a single controller

Simulation

Simulation of Linear systems

- Build NN that outputs \hat{x} from the system $\dot{x} = Ax + c$ given c
- Group of LIF neurons with with intrinsic Voltage, tracking the projected error $V_i = F(x - \hat{x}) + \mu r_i$
- Network decoding $\hat{x} = F^T r$

$$\dot{V} = -\lambda_V V + Fc + W^f o(t) + W^s r(t) + \sigma_V \eta(t)$$

Geometric

Control

Control Concept

[HC19]

(Almost) identical network architecture

- Network output is external input into (previous) simulating network \longleftrightarrow Network state contains control signal
- Governed by PD-control as $c = \dot{x} - Ax$
- In presence of output matrix $C \neq I \leftrightarrow \text{rank}(B^T C^T) = \text{rank}(B^T)$

$$V_i = F_i(x - \hat{x}) - \mu r_i$$

Learning rules [BD15]

Slow Learning rule $W^s = F(A + \lambda_d I)F^T$

- Online Learning of Student teacher dynamics $\dot{\hat{x}} = M\hat{x} + c$
- Error Feedback Ke during Training
- $\delta M \propto e\hat{x}^T \rightarrow \delta W^s \propto F(e\hat{x}^T)F^T \approx F e r^T$
- Error alignment?
- Supervised Learning rule

Fast Learning rule $W^f = FF^T + \mu I$

- Voltage measures system error
- Minimize average Voltage outside of Neuron Threshold
- Biologically plausible pre-post locally
- Unsupervised Learning Rule

Control Concept II

Problems

In conjunction, problems can arise:

- Divergence in Learning
- Control with Noise
- Reliance on analytic results
- Biologically implausible Learning

Dual Network

No Learning rule for control network available

Open Loop Control:

- Incapable of noise detection or correction
- No Compensation of Training error

Highly dependent on governing dynamics from $c_{\text{contr}} = \dot{x}_{\text{ref}} - Ax_{\text{ref}}$

Dual Network with Feedback

No Learning rule for control network available

Open loop Control:

- Incapable of noise detection or correction
- No Compensation of Training error

Highly dependent on governing dynamics from $C_{\text{contr}} = \dot{x}_{\text{ref}} - Ax_{\text{ref}}$

Single Network

No Learning rule for control network available

Open Loop Control:

- Incapable of noise detection or correction
- No Compensation of Training error

Highly dependent on governing dynamics from $\mathbf{C}_{\text{contr}} = \dot{\mathbf{x}}_{\text{ref}} - \mathbf{A}\mathbf{x}_{\text{ref}}$

Orthonormality restriction on Input Matrix $\mathbf{B} \in \mathbb{B} := \{\mathbf{M} \mid \mathbf{M}^T \mathbf{M} = \mathbf{I}\}$

Single Network with Feedback

No Learning rule for control network available

Open-loop Control:

- Incapable of noise detection or correction
- No Compensation of Training error

Highly dependent on governing dynamics from $\dot{c}_{\text{contr}} = \dot{x}_{\text{ref}} - Ax_{\text{ref}}$

Orthonormality restriction on Input Matrix $B \in \mathbb{B} := \{M \mid M^T M = I\}$

Conclusion

Conclusion

- Open loop and inaccurate learning of slow weights W^s need to be addressed.
- Highly dependent on initial conditions in learning
- Impressive accuracy
- In ideal conditions useable results achievable
- Limited Applicability → Only of theoretical Interest
- Results are somewhat translatable to NEF and LSMs

Choice between biologic plausibility or and Input Matrix Restriction for accurate results

Future Work

- Enable non-linear dynamics
- Obey Dale's Law for neuron excitation and inhibition
- Optimize Control
- Learning of En- and Decoder Γ
- Allow for synaptic delays
